

A B S T R A C T (US)

The invention relates notably to a method for handling calls received from a radio communication network at a wireless mobile terminal, the wireless mobile terminal comprising at least one short-range interface for communicating with office devices located under the range of the short-range interface,

According to the invention, the method consists in:

- identifying at the wireless mobile terminal office devices located under the range of the short-range interface and able to handle at least one call type belonging to a list of predefined call types;
- upon reception of a call from the radio communication network at the wireless mobile terminal, the call having a call type belonging to the predefined list, selecting an office device able to handle the call type; and
- forwarding the call to this office device.
